Technical Requirements

The DriverPass system will be developed as a web-based application that allows users to access the platform from any device with an internet connection. This ensures flexibility and convenience for customers and staff. The system will be hosted on a cloud-based server to provide scalability, reliability, and consistent availability.

The system will require secure user authentication to protect user accounts and sensitive information. All user data, including personal details and payment information, must be stored securely using encryption and protected databases. Role-based access will be implemented so that different users, such as customers, instructors, and administrators, only have access to the features relevant to their roles.

The system will use a database management system to store and manage key data such as user accounts, lesson schedules, practice test results, and payments. Real-time updates will be required to ensure that lesson availability and scheduling information are accurate and up to date.

The system must also be compatible with modern web browsers and responsive across different devices, including desktops, tablets, and mobile phones. This ensures that users can easily access the system regardless of their device.

Finally, the system will require ongoing maintenance, updates, and monitoring to ensure performance, security, and reliability. Regular updates will allow the system to adapt to future needs and improvements.
